                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New high growth methanotrophic bacterial strain, useful for producing single cell proteins, grows on a Cl carbon substrate, and comprises a functional gene encoding in Embden-Meyerhof carbon pathway

Claim 11; Page 142-143; 157pp; English.

present. The bacterial strain of the invention can be used as a denitrifying agent for the conversion of nitrate or nitrite to nitrous oxide with methane or methanol as a carbon source. It is also used in the production of biomass including proteins, carbohydrates and a wide variety of pigments (particularly for isoprenoid pigments for the purpose of generating animal feeds), in production of terpenoid and carotenoid compounds, useful as pigments and as monomers in polymeric materials and in production of texpolysaccharides at high levels. Sequences ABG61551-ABG61590 represent high growth methanotrophic bacterial strain proteins of the invention. The invention relates to a high growth methanotrophic bacterial strain, which grows on a Cl carbon substrate e.g. methane and methanol, and comprises a functional Embden-Meyerhof carbon flux pathway comprising a gene coding a pyrophosphate dependent phosphofrutokinase enzyme or a 16 RNA. The bacterial strain is useful for the production of single cell protein and for the biotransformation of a nitrogen-containing compound, e.g. ammonia, nitrate, nitrite or nitrogen. It is also useful for the production of a feed product comprising a protein, carbohydrates and a pigment and for reducing oxygen demand, for removing nitrates and nitrites in methane-containing environments such as landfills, waste water treatment systems or anywhere that methane, oxygen and nitrates are 168 the

Producing carotenoid compounds e.g. antheraxanthin and astaxanthin, by using microorganisms having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolize single carbon

Claim 45; Page 118-119; 156pp; English.

encoding an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astaxanthin, by using microorganism having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolise single carbon substrates. The carotenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of steroids flavours and fragrances and compounds for potential electro-optic applications. The present sequence is Methylomonas 16a sp. 2C-methyl-d-exythrical 2,4-cyclodiphosphate The method comprises a transformed metabolising carotenoid compounds. suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule control of recularors. (IspF) enzyme used in the invention. carbon in À

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a new nucleic acid molecule encoding an isoprenoid biosynthetic enzyme isolated from Methylomonas 16a. The invention is useful for obtaining a nucleic acid molecule encoding an isoprenoid compound biosynthetic enzyme, and for the microbial production of isoprenoid compounds. The molecules of the invention are also useful for regulating isoprenoid biosynthesis in an organism and for producing recombinant organisms for producing various isoprenoid compounds. The nucleic acid is also useful for feed additive, for the production of keratenoids and their derivatives, isoprenoid intermediates, and as pure products useful as pigments, flavours and fragrances. The present amino acid sequence represents the Methylomonas 16a open reading frame 5 (ORP5) ygbB/isp? (2C-methyl-d-erythritol 2s,4-cyclodiphosphate synthase enzyme) protein of the invention, as

Recombinant microorganisms in which expression of (I) or (Ia) can be regulated are used to identify compounds that bind to the gene products, particularly in affinity selection assays. (II) and (IIa) are used to identify, or prepare, antibacters and other proteins that bind to the gene products. Substances that bind to the yene protentially useful as antibacterials for treating a wide range of infections in humans and animals. Sequences antisense to (I) and (Ia) can also be used as antibacterials. The specified genes are widely distributed in bacteria but have no close homologs in eukaryotic cells.
                                                                                                                                                                     Bacterial growth; inhibitor; ygbB; yfhC; yacE; ychB; yejD; yrfI; yggJ; yjeB; yiaO; yrdC; yhbC; ygbF; ybeY; gcgB; kdtB; pfs; ycaJ; b1808; yeaA; yagF; b1983; yidD; yceG; yjbC; antibacterial compound; H. influenza; S. pneumoniae; H. pylori; B. burgdorferi; pesticide; M. tuberculosis; antibiotic.

                                                                                                                                                                                                                                              2-C-methyl-D-erythrytol-2,4-cyclodiphosphate synthetase; non-mevalonate pathway; 2-C-methyl-D-erythrytol-2,4-cyclodiphosphate; 2-phospho-4-(cytidine 5'-diphospho) 2-C-methyl-D-erythrytol; CDP-MEZP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to antagonists and inhibitors of 24 bacterial genes and proteins. The proteins are thought to be essential for growth in several species of bacteria (including S. pneumoniae, B. burgdorferi, H. influenza and H. pylori). The proteins and coding sequences shown in the specification can be used to identify antagonists and inhibitors which can be used in disease treatment and pesticides. In particular, they can be used against M. tuberculosis. The present sequence is one of the proteins of the invention.

The enzyme is involved in the non-mevalonate pathway. It acts on 2-phospho-4-(cytidine 5'-diphospho) 2-C-methyl-D-erythrytol (CDP-ME2P). to produce 2-C-methyl-D-erythrytol-2,4-cyclodiphosphate and cytidine 5'-monophosphate. The enzyme has a molecular weight of 22 kDa, as determined by sodium dodecyl sulfate polyacrylamide gel electrophoresis. The enzyme or gene can be used to increase isoprenoid compound

The crystal is useful in an inhibitor-screening assay, and identified inhibitors are useful as antibiotics against bacteria or protozoa especially malarial parasite e.g. Plasmodium falciparum, and as herbicides. The inhibitors are also useful for inhibiting the synthesis of isoprenoids. The present sequence is 2C-methyl-p-erythritol 2,4-cyclodiphosphate synthase from Escherichia coli, encoded by the ispF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to antagonists and inhibitors of 24 bacterial genes and proteins. The proteins are thought to be essential for growth in several species of bacteria (including S. pneumoniae, B. burgdorferi, H. influenza and H. pylori). The proteins and coding sequences shown in the specification can be used to identify antagonists and inhibitors which can be used in disease treatment and pesticides. In particular, they can be used against M. tuberculosis. The present sequence is one of the proteins of the invention.
                                                                                                                                                                            WPI;
                                                                                            Disclosure;
                                                                                                                   Identifying antibacterial compounds, comprises identifying an antagonist or inhibitor of the expression of a gene encoding polypeptide essential for bacterial growth or survival.
                                                                                                                      polypeptide
                                                                                                                                                                                                                                                           09-APR-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          60
```

The present invention relates to antagonists and inhibitors of 24 bacterial genes and proteins. The proteins are thought to be essential for growth in several species of bacteria (including S. pneumoniae, B. burgdorferi, H. influenza and H. pylori). The proteins and coding sequences shown in the specification can be used to identify antagonists and inhibitors which can be used in disease treatment and pesticides. In

The present invention relates to a crystal comprising 2C-methyl-p-erythritol 2,4-cyclodiphosphate synthase with or without zinc. The crystal is useful an inhibitor-screening assay, and identified inhibitors are useful as antibiotics against bacteria or protozoa especially malarial parasite e.g. plasmodium falciparum, an as herbicides. The inhibitors are also useful for inhibiting the
                                                                                                                                                                                                                                                Novel crystal useful for identifying a potential inhibitor of 2C-methyl-D-erythritol 2,4-cyclodiphosphate synthase, comprises 2C-methyl-D-erythritol 2,4-cyclodiphosphate synthase protein with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein co-ordinate data; herbicide; protozoacide; antibacterial; antibictic; isoprenoid synthesis; crystal; enzyme; 2C-methyl-p-erythritol 2,4-cyclodiphosphate synthase; malaria; Plasmodium falciparum; ispF; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      particular, they can be used against M. tuberculosis. The present sequence is one of the proteins of the invention.

2C-methyl-D-erythritol 2,4-cyclodiphosphate synthase; malaria;
Plasmodium falciparum; ispF; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       synthesis of isoprenoids. The present sequence is a mutant of 2C-methyl-D-erythritol 2,4-cyclodiphosphate synthase which was in an example from the invention.

Note: The present sequence is not shown in the specification, derived from the wild-type sequence of Escherichia coli 2C-methyl-D-erythritol 2,4-cyclodiphosphate synthase (ABP70685)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61
```

The present invention relates to a crystal comprising 2C-methyl-D-erythritol 2,4-cyclodiphosphate synthase

with

å

Example 3; Page -; 214pp;

English

Novel crystal useful for identifying a potential inhibitor 2C-methyl-D-erythritol 2,4-cyclodiphosphate synthase, compact-methyl-D-erythritol 2,4-cyclodiphosphate synthase proteins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              zinc. The crystal is useful in an inhibitor-screening assay, and identified inhibitors are useful as antibicines against bacteria or protozoa especially malarial parasite e.g. Plasmodium falciparum, and as herbicides. The inhibitors are also useful for inhibiting the synthesis of isoprenoids. The present sequence is a mutant of 2C-methyl-p-erythritol 2.4-cyclodiphosphate synthase which was generated in an example from the invention.

The crystal is useful in an inhibitor-screening assay, and identified inhibitors are useful as antibiotics against bacteria or protozoa especially malarial parasite e.g. plasmodium falciparum, and as herbicides. The inhibitors are also useful for inhibiting the synthesis of isoprenoids. The present sequence is a mutant of 20-methyl-p-crythritol 2,4-cyclodiphosphate synthase which was generated in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                 Misc-difference

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             몽
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a 2C-methyl-D-erythritol 2,4-cyclodiphosphate CC synthase (MSCPS) protein, or a functional MECPS protein subunit, in CC crystalline form. The invention also relates to a computer readable database comprising representation of a compound capable of binding a CC binding pocket of an MECPS protein. The methods are useful for producing CC a compound comprising a 3D molecular structure represented by the CC coordinates contained in a compouter readable database, modulating MECPS protein activity by contacting the MECPS with a compound, identifying an activator or inhibitor of a protein that comprises an MECPS active site or binding pocket, producing a mutant MECPS protein having an altered CC or binding pocket, producing a mutant MECPS protein having an altered CC property relative to an MECPS protein is useful for identifying and CC designing inhibitors and activators of MECPS, for designing and compound CC designing inhibitors and activators of MECPS, for designing format of MECPS corrected biochemical, metabolic or anabolic pathway, or for rational CC drug design to identify and/or design compounds that bind MECPS for corretion of the invention agents. This sequence represents the MECPS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

Also disclosed are the nucleic acid molecules encoding the proteins an antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention.
                                                                                            Identifying an antigen for manufacturing a vaccine against meningococcal infection, comprises contacting antibodies with polypeptides, detecting polypeptide-antibody complexes, and it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vaccine; antigen; meningitis.

polypeptides as antigens

```
cc (a) obtaining antibodies against a commensal bacteria, or an extract (c) polypeptides obtained from an expression library of either a commensal or c polypeptides and (d) (where a polypeptide binds to an antibodies with commensal or c antibodies; and (d) (where a polypeptide binds to an antibody) contacting whether the polypeptides bind to c antibodies; and (d) (where a polypeptide binds to an antibody) c dentifying that polypeptide as an antigen. Also included are: (1) a method of preparing a vaccine composition, comprising identifying c an antigen with the above method, and combining the antigen with a ccarrier; (2) a vaccine composition obtained by the above methods; (d) an antigen identified by the above methods; (d) a polypeptide composition obtained by the above methods; (d) a polypeptide composition of a mucleic acid sequence comprising the composition of comparing the mucleic acid molecule; (d) a method of comparing the mucleic acid molecule; (e) a method of comparing the mucleic acid molecule; (e) a method of comparing the sequence of the first antigen from a pathogenic bacteria, or comparing the sequence of the second antigen from a pathogenic comparing the sequence of the second antigen from a pathogenic comparing the sequence of the first antigen composition of the second antigen and (e) preparing a composition comparing the sequence of the nucleic acid which codes for the first antigen with the sequence of the nucleic acid which codes for the second antigen, and (e) preparing a composition comparish the second antigen, and (f) preparing a composition comparish bacterial infection comprising the first antigen; the method is useful in screening commensal and pathogenic bacterial proteins. The polypeptide antigens by identifying control bacterial proteins that binds to sera raised against commensal composition comparish the methogenic bacterial proteins from the pathogenic bacteria N.
                                                                                                                                                                                                                                                                                                            sequence represents an antigenic protein from the pathogenic bacteria N. meningitidis.
                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to identifying an antigen comprising:
(a) obtaining antibodies against a commensal bacteria. or a
